Experience

- **Optum, Remote**

Software Engineer

Aug 2026 - Present

- Lead application-level Kubernetes migrations across the organization, driving standardized Helm adoption and developing an AI-assisted skill to streamline translation from legacy charts and accelerate migration efforts.
- Build an event-driven notification system for Angular applications using Azure SignalR, C#, MongoDB, and Kafka, enabling real-time visibility into asynchronous workflows.
- Continue participating in an on-call rotation, triaging critical bugs and collaborating with the product team to deploy hotfixes, while mentoring early-career employees across the enterprise and contributing to the Technology Development Program bootcamp.

Associate Software Engineer

Aug 2025 - Aug 2026

- Developed a common Helm chart for 60+ services, establishing standardized Kubernetes deployment patterns and reducing configuration drift across the platform.
- Migrated UI applications from Azure Front Door to Azure Kubernetes Service, reducing cloud costs by 12%.
- Prototyped an Nx monorepo using GitHub Spec-Kit to evaluate Spec-Driven Development workflows for AI-assisted development.

Technology Development Program Associate

Jul 2024 - Aug 2025

- Architected a web application with Go, Templ, and PostgreSQL that collects and analyzes the current running state of networking devices, assisting network engineers to quickly identify problems when a site goes down.
- Designed a web-based wrapper for Ansible using Python and Django to provide non-engineers an accessible interface to execute batch data collection jobs on a user-defined set of networking devices.
- Built a GitHub Actions library using TypeScript and Bash to promote code reusability in CI/CD pipelines.

Technology Development Intern

Jun 2022 - Jul 2024

- Migrated Java Spring APIs and supporting data infrastructure from on-premises environments to AWS EKS and OpenSearch, improving availability and reducing costs.
- Automated AWS workflows and infrastructure using Lambda, Step Functions, Terraform, and CI/CD pipelines, standardizing resource provisioning and streamlining data ingestion and deployments.
- Built a React.js/TypeScript web application with an Express.js API to provide user-friendly visibility into business events flowing through an existing data pipeline.

Education

- **Marist University, Poughkeepsie, NY**

Master of Science in Software Development

2023 - 2024

Bachelor of Science in Computer Science

2020 - 2023

Projects

- Created a system resource metrics monitor for Linux machines using Rust, TypeScript, React.js, and SQLite.
- Implemented the Potential Fields algorithm for an Arduino-based robot to navigate through an obstacle course and reach an end goal.
- Built a compiler in Rust for a custom language grammar that targets 6502 opcodes and RISC-V assembly.
- Developed an operating system in TypeScript that manages and executes programs and handles operations related to a virtual file system.
- Created a virtual ARM processor in Go and utilized it as a package within a website built with React.js and JavaScript on the front-end and Gin and Go on the back-end.
- Created a social media web application using the MongoDB, Express.js, EJS, and Node.js stack in JavaScript.
